SUPPLEMENT TO [REDACTED]

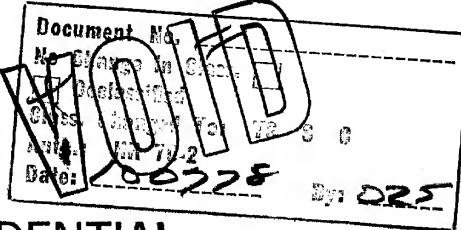

25X1X 1. [REDACTED] huge deposits of petroleum sands of very ancient geological formation are located in the district of the Gjanice River, between the settlements of Lalad and Patos; they cover an area of 35 square kilometers.

2. During the war, when these petroleum wells were being exploited by the AIP enterprise (sic - ?AIPA "Azienda Italiana di Petrolio in Albania"), various tests and soundings were carried out to establish whether it would be worthwhile to utilize these sands. For this purpose a large gallery was dug up, and testings established that there was approximately one hundred million cubic meters of this petroleum-bearing sand, and that it will produce 10 percent petroleum and benzol. A large building, to handle these tests, had been partially built prior to World War II; it had not been completed, and during the war it was completely demolished.

25X1X 3. [REDACTED] intensive testing of particles of this sand had been done during a period of close cooperation between Yugoslavia and Albania, and samples were sent to Rijaka, where tests produced positive results. [REDACTED] the Yugoslavs had planned to utilize this sand in the production of asphalt conglomerates, but these plans were not implemented following the Yugoslav-Albanian rift.

This document is hereby regraded to CONFIDENTIAL in accordance with the letter of 16 October 1978 from the Director of Central Intelligence to the Archivist of the United States.
